ENG 346 Data Structures and Algorithms for Artificial Intelligence

Matrix Operations and Numpy

Dr. Mehmet PEKMEZCİ

mpekmezci@gtu.edu.tr

https://github.com/mehmetpekmezci/GTU-ENG-346

Matrices

- Matrices can be used to store data
  - Image data (nxm) matrix
  - Sound data (nx1) matrix
  - Any Log data (nxm) matrix,
    - e.g. : log of humidity, temperature, … values in a room
  - Geometric data
- Matrices can be used for Linear Transformations (Linear Function)
  - Rotation
  - Translation
  - Stretching

Determinants and Inverse of a Matrix

Example : 4x4 matrix A=

$$\begin{array}{|c|c|c|c|}\hline a & b & c & d \\ \hline e & f & g & h \\ \hline i & j & k & l \\ \hline m & n & o & p \\ \hline\end{array}$$

Minor of element b is det(M_{12}), **M_{12} =** $\begin{array}{|c|c|c|}\hline e & g & h \\ \hline i & k & l \\ \hline m & o & p \\ \hline\end{array}$

Cofactor(A) is a matrix composed of C_{ij} .

$C_{ij} = (-1)^{i+j} \det(M_{ij})$

det(A)=|A| = **a . det (** $\begin{array}{|c|c|c|c|}\hline & & & \\ \hline & f & g & h \\ \hline & j & k & l \\ \hline & n & o & p \\ \hline\end{array}$ **)** **- b . det (** $\begin{array}{|c|c|c|c|}\hline & & & \\ \hline e & & g & h \\ \hline i & & k & l \\ \hline m & & o & p \\ \hline\end{array}$ **)**

+ c . det ($\begin{array}{|c|c|c|c|}\hline & & & \\ \hline e & f & & h \\ \hline i & j & & l \\ \hline m & n & & p \\ \hline\end{array}$ **)** **- d . det(** $\begin{array}{|c|c|c|c|}\hline & & & \\ \hline e & f & g & \\ \hline i & j & k & \\ \hline m & n & o & \\ \hline\end{array}$ **)**

$$\begin{array}{|c|c|c|c|}\hline C_{11} & C_{12} & C_{13} & C_{14} \\ \hline C_{21} & C_{22} & C_{23} & C_{24} \\ \hline C_{31} & C_{32} & C_{33} & C_{34} \\ \hline C_{41} & C_{42} & C_{43} & C_{44} \\ \hline\end{array}$$

Inverse of A

$A^{-1} = 1/\det(A). (\text{Cofactor}(A))^T$

NO INVERSE
if det(A)=0 or
matrix is not square

Transpose and Inverse Properties

$A \, . \, A^{-1} = A^{-1} \, . \, A = I$

$(A^{-1})^{-1} = A$

$(A^T)^T = A$

$(A^T)^{-1} = (A^{-1})^T$

$(AB)^T = B^T \, . \, A^T$

$(A+B)^T = A^T + B^T$

$(AB)^{-1} = B^{-1} \, . \, A^{-1}$

$(k.A)^{-1} = 1/k \, . \, A^{-1}$

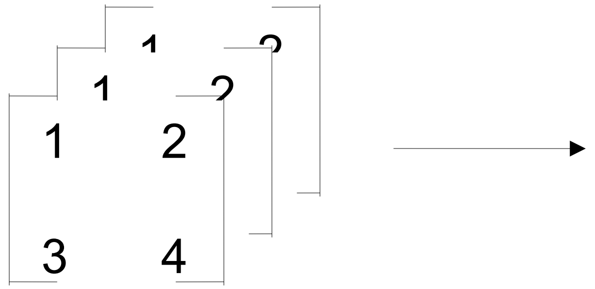
$(k.A)^T = k \, . \, A^T$

$\det(A^T) = \det(A)$

$\det(A^{-1}) = 1/\det(A)$

Tensors (Multilinear Map)

- Vectors = 1st order Tensor $\begin{bmatrix} 1 \\ 3 \end{bmatrix}$ (1D arrays)
- Matrices = 2nd order Tensor $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ (2D arrays)
- 3rd order Tensor , is a stack of matrices (3D arrays)

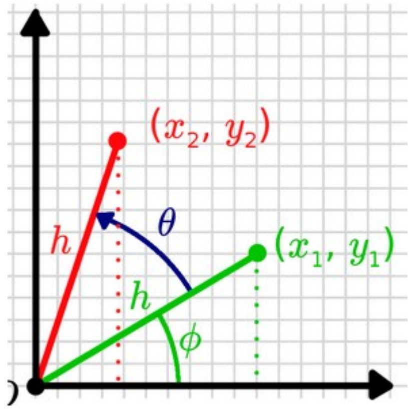


2 x 2 x 3 Tensor (I ,j, k indices)

- Tensor may have n order.

Matrices – Geometric Meaning

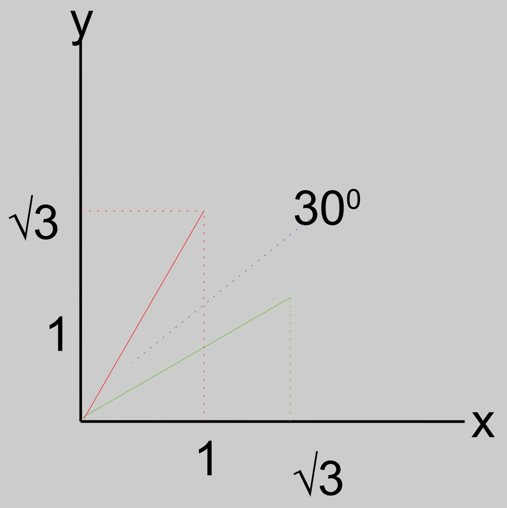
- **Rotation**



$$\begin{bmatrix} x_2 \\ y_2 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) \\ \sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} x_1 \\ y_1 \end{bmatrix}$$

NOTE: 3D rotation matrix is a 3x3 matrix, not a 2x2x2 tensor

Example :



$$\begin{bmatrix} 1 \\ \sqrt{3} \end{bmatrix} = \begin{bmatrix} \cos(\pi/6) & -\sin(\pi/6) \\ \sin(\pi/6) & \cos(\pi/6) \end{bmatrix} \begin{bmatrix} \sqrt{3} \\ 1 \end{bmatrix}$$

```
import numpy as np
theta = np.radians(30)
c, s = np.cos(theta), np.sin(theta)
R = np.array(((c, -s), (s, c)))
green_vector=np.array([np.sqrt(3),1])
print(green_vector)
red_vector=np.dot(R,green_vector)
print(red_vector)
```

https://articulatedrobotics.xyz/tutorials/coordinate-transforms/rotation-matrices-2d/

Matrix Operations

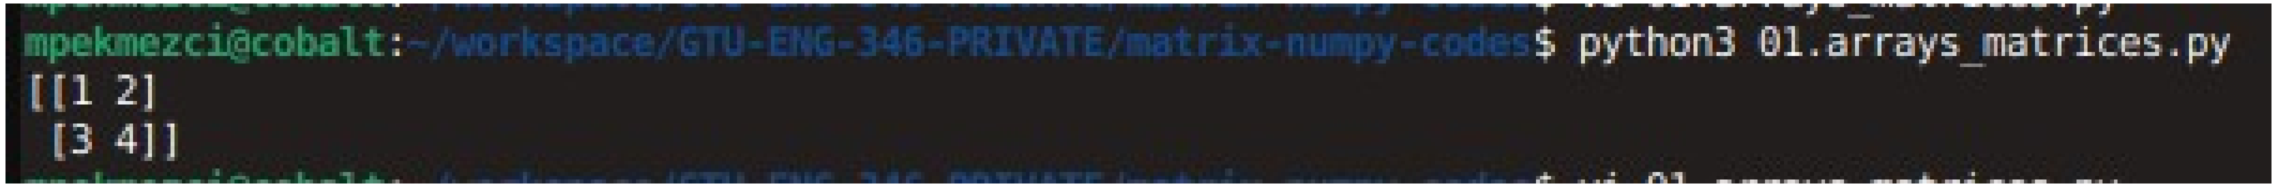
- Matrix/Tensor Construction
- Dimensions (Shape) and reshaping, array slicing, masking.
- Matrix Summation
- Transpose of the Matrix
- Matrix Multiplication
- Inverse of the Matrix
- Stacking (Vertical, Horizontal, Depth)
- Splitting (Vertical, Horizontal)

- **NOT COVERED : Eigenvalues, Eigenvectors, SVD , Tensor Dot**

Matrix/Tensor Construction

$$\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \longleftrightarrow$$

```
import numpy as np
a = np.array( [   [1, 2] , [3, 4] ] )
print(a)
```



```
mpekmezci@cobalt:~/workspace/GTU-ENG-346-PRIVATE/matrix-numpy-codes$ python3 01.arrays_matrices.py
[[1 2]
 [3 4]]
```

$$\begin{bmatrix} 10 & 10 \\ 10 & 10 \end{bmatrix}$$

```
np.full((2, 2), 10,dtype=int)
# 2 rows, 2 columns
```

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

```
number_of_rows=2
np.identity(number_of_rows,dtype=int)
```

$$\begin{bmatrix} 0.0 & 0.0 \\ 0.0 & 0.0 \end{bmatrix}$$

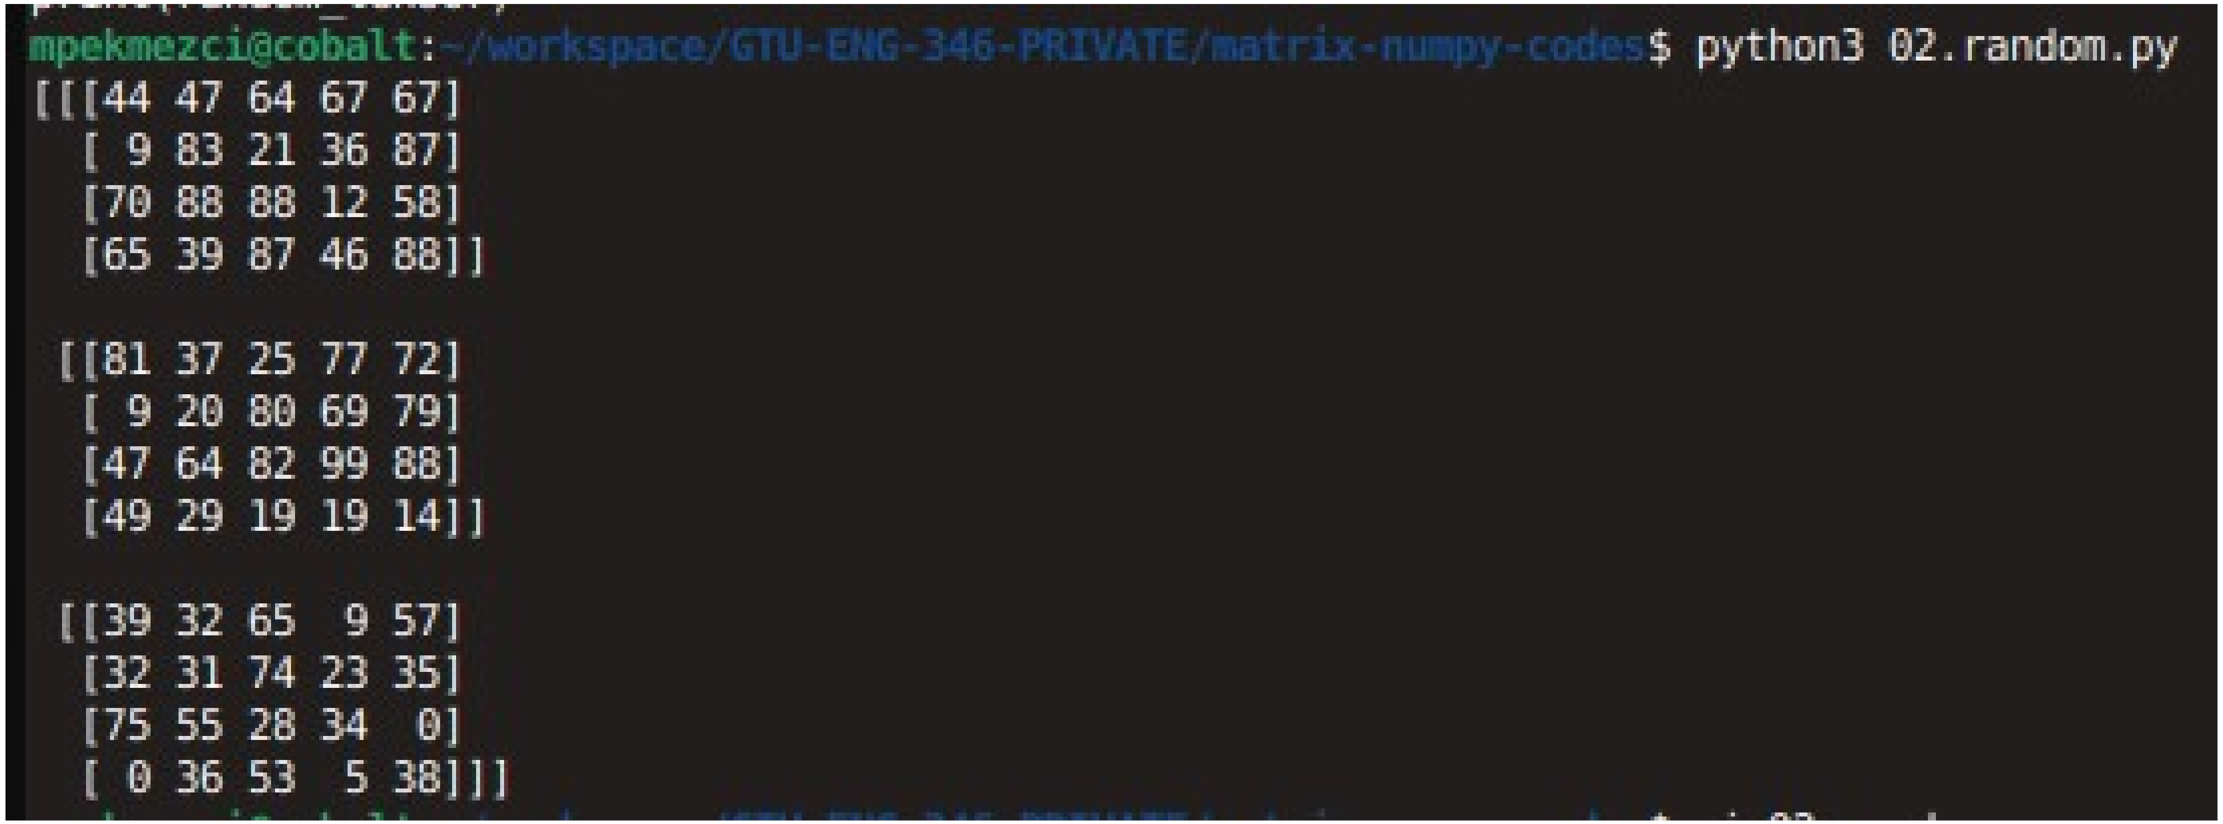
```
np.zeros(2)
# default dtype=float
```

$$\begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$$

```
np.full((2, 2), 10, dtype=float)
# 2 rows, 2 columns
```

Matrix/Tensor Construction

```
import numpy as np
np.random.seed(0)  # seed for reproducibility
random_tensor = np.random.randint(100, size=(3, 4, 5))
print(random_tensor)
```



```
mpekmezci@cobalt:~/workspace/GTU-ENG-346-PRIVATE/matrix-numpy-codes$ python3 02.random.py
