Dr. Mehmet PEKMEZCİ

mpekmezci@gtu.edu.tr

https://github.com/mehmetpekmezci/GTU-ENG-346

ENG-346-FALL-2025 Teams code is **4b108kr**

# Codes

- https://github.com/mehmetpekmezci/GTU-ENG-346/tree/main/python-codes

# Rules

- Write READABLE and EASY-TO-MAINTAIN code !!!

  - **Self Descriptive Code :** Always use long descriptive names for functions/classes/variables. Do not use i,j ….

  - All variables are on top ( Class/function or python file)

  - All imports are on top.

  - Do not use numbers directly, first assign them to a variable.
    (e.g. ~~if distance>100,~~   MAX_DISTANCE=100;if distance >MAX_DISTANCE)

  - Constant variable names are all capital (e.g. MAX_DISTANCE)

- Minimum usage of global variables, always use local variables.

# About Python

- Python is an *interpreted*, *object-oriented* and *high-level* programming language.

    - C/C++/Rust/GO → compiled into binary (machine language)

    - Java → compiled into byte code, then byte codes are interpreted by jvm

    - Perl/PHP/Python/Shell Scripts (Bash) → Directly interpreted by their interpreter programs.

- Created by Guido van Rossum, a Dutch programmer, in 1989.

- First public release: Python 0.9.0 in 1991.

- Python 2.0 released in 2000.

- Python 3.0 released in 2008.

# How to Access Python Interpreter?

- Official Website: https://www.python.org/
  - Interpreter + pip
  - Jupyter notebook via "jupyter" package

- Anaconda: https://anaconda.org/
  - Interpreter + conda + pip
  - Jupyter notebook via "jupyter" package

- Google Colab: https://colab.research.google.com/
  - Via Colab notebooks (like Jupyter notebooks)

- Kaggle: https://www.kaggle.com/
  - Via Kaggle notebooks (like Jupyter notbooks)

# OR – Windows Subsystem for Linux (WSL)

```
## https://learn.microsoft.com/en-us/windows/wsl/install
## https://ubuntu.com/desktop/wsl

## In poweshell :

Wsl --list --online

Wsl --install Ubuntu-24.04

Wsl -d Ubuntu-24.04

## Linux Shell Starts Here

sudo apt update
sudo apt install python3-pip
pip3 install matplotlib numpy pandas

## The first time you run code from Ubuntu, it will trigger a download of the necessary
dependencies:
code .
```

# Python Basics

- Variable naming: case-sensitive (e.g., temp vs Temp vs TEMP)

- Reserved words: cannot be used as variables.
    - False as continue else from in not return yield None assert def except global is or try True break del finally if lambda pass while and class elif for import nonlocal raise with

- Dynamically typed: No declarations are needed for the variables.

- Everything is basically an Object.

- Indentation is very important !

# Indentation

**CORRECT**

```python
import sys

def main():
  if len(sys.argv) < 2 :
    print("Usage: python3 main.py <first_argument>")
    exit(1)
  FIRST_ARGUMENT=float(sys.argv[1])
  COEFFICIENT=6.75
  RESULT=COEFFICIENT*FIRST_ARGUMENT
  print(f"RESULT={RESULT}")
  USER_INPUT=input("Enter Another VALUE: ")
  RESULT=COEFFICIENT*float(USER_INPUT)
  print(f"2. RESULT={RESULT}")

if __name__ == '__main__':
 main()
```

**INCORRECT**

```python
import sys

def main():
  if len(sys.argv) < 2 :
    print("Usage: python3 main.py <first_argument>")
    exit(1)
  FIRST_ARGUMENT=float(sys.argv[1])
  COEFFICIENT=6.75
  RESULT=COEFFICIENT*FIRST_ARGUMENT
  print(f"RESULT={RESULT}")
USER_INPUT=input("Enter Another VALUE: ")
  RESULT=COEFFICIENT*float(USER_INPUT)
  print(f"2. RESULT={RESULT}")

if __name__ == '__main__':
 main()
```

**ENG 346 – Data Structures and Algorithms for Artificial Intelligence**

# Arguments and User Input

**main.py**

```python
import sys

def main():
    if len(sys.argv) < 2 :
        print("Usage: python3 main.py <first_argument>")
        exit(1)
    FIRST_ARGUMENT=float(sys.argv[1])
    COEFFICIENT=6.75
    RESULT=COEFFICIENT*FIRST_ARGUMENT
    print(f"RESULT={RESULT}")
    USER_INPUT=input("Enter Another VALUE: ")
    RESULT=COEFFICIENT*float(USER_INPUT)
    print(f"2. RESULT={RESULT}")

if __name__ == '__main__':
    main()
```

```
mpekmezci@cobalt:/tmp$ python3 main.py
Usage: python3 main.py <first_argument>
mpekmezci@cobalt:/tmp$ python3 main.py 7
RESULT=47.25
Enter Another VALUE: 8
2. RESULT=54.0
mpekmezci@cobalt:/tmp$
```

    return n
```

# Built-in Func

| Common Built-In Functions | |
|---|---|
| **Calling Syntax** | **Description** |
| abs(x) | Return the absolute value of a number. |
| all(iterable) | Return True if bool(e) is True for each element e. |
| any(iterable) | Return True if bool(e) is True for at least one element e. |
| chr(integer) | Return a one-character string with the given Unicode code point. |
| divmod(x, y) | Return (x // y, x % y) as tuple, if x and y are integers. |
| hash(obj) | Return an integer hash value for the object (see Chapter 10). |
| id(obj) | Return the unique integer serving as an "identity" for the object. |
| input(prompt) | Return a string from standard input; the prompt is optional. |
| isinstance(obj, cls) | Determine if obj is an instance of the class (or a subclass). |
| iter(iterable) | Return a new iterator object for the parameter (see Section 1.8). |
| len(iterable) | Return the number of elements in the given iteration. |
| map(f, iter1, iter2, ...) | Return an iterator yielding the result of function calls f(e1, e2, ...) for respective elements $e1 \in iter1, e2 \in iter2, ...$ |
| max(iterable) | Return the largest element of the given iteration. |
| max(a, b, c, ...) | Return the largest of the arguments. |
| min(iterable) | Return the smallest element of the given iteration. |
| min(a, b, c, ...) | Return the smallest of the arguments. |
| next(iterator) | Return the next element reported by the iterator (see Section 1.8). |
| open(filename, mode) | Open a file with the given name and access mode. |
| ord(char) | Return the Unicode code point of the given character. |
| pow(x, y) | Return the value $x^y$ (as an integer if $x$ and $y$ are integers); equivalent to x ** y. |
| pow(x, y, z) | Return the value $(x^y \bmod z)$ as an integer. |
| print(obj1, obj2, ...) | Print the arguments, with separating spaces and trailing newline. |
| range(stop) | Construct an iteration of values $0, 1, \ldots, stop - 1$. |
| range(start, stop) | Construct an iteration of values $start, start + 1, \ldots, stop - 1$. |
